RENAME

RENAME *old TSP variable* *new TSP variable* ;

Function:

RENAME changes the name of an old TSP variable (series, matrix, constant, etc.).

Examples:

Save the coefficients from a regression in the vector B1. Note: this is more efficient than COPY, if there is no reason to save the original @COEF.

```
OLSQ Y C X;
RENAME @COEF B1;
```

Output:

The name of the variable is changed. If a variable already exists with the new name, it is deleted.
