THINGS YOU SHOULD KNOW FROM ECONOMICS 1

- 1. GDP is simultaneously a measure of aggregate output and aggregate income.
- 2. The unemployment rate is not a perfect indicator of the "unemployment problem."
- 3. In the Keynesian model, Planned Expenditures (or, Aggregate Demand) is equal to Aggregate Demand = C + I + G + EX IM = C + I + G + NX
- 4. Macroeconomic equilibrium in the Keynesian model is characterized by the existence of a level of aggregate output (which equals aggregate income) such that aggregate output = aggregate expenditures. Using the notation,
 macroeconomic equilibrium is the level of Y such that Y = C + I + G + NX.
- 5. The process of adjustment to macroeconomic equilibrium is an *output* (not price) adjustment process.
- 6. Consumption (C) increases with disposable income (Y^D), though the change in consumption is generally less than the corresponding change in disposable income. That is, $C = C_0 + C_v \cdot Y^D, \text{ where } C_v \text{ is the mpc and } 0 < C_v < 1$
- 7. Disposable income (Y^D) equals Income (Y) Net Taxes (T). Net Taxes equal Tax Payments (TA) Transfer Payments (TR). So $Y^D = Y T = Y + TR TA$.
- 8. Investment and interest rates tend to be inversely related. Interest rates are not the *only* determinant of investment, however.
- 9. The G of C + I + G does not include *all* government outlays. Only government purchases of goods and services are included in G. Other government outlays (transfer payments) are part of Y^D .
- 10. The government's budget deficit is the difference between government outlays (G+TR) and government receipts (TA) for a specific year. The government's debt is the sum of all the budget deficits less the sum of all the budget surpluses over time.
- Adjusting G, TR (Transfer payments), or TA (Tax payments) to achieve macroeconomic goals is *fiscal* policy.
- 12. Adjusting M (amount of money) or i (interest rates) to achieve macroeconomic goals is *monetary* policy.
- 13. Capital (K) includes structures (buildings), equipment (machines), and items in inventory. Money, stocks, bonds, or other financial assets are *not* included in capital.
- Long-run economic growth in an economy's production possibilities are the result of increases in the quantity of resources (Land, Labor, Capital) or increases in productivity.
- 15. Perfectly competitive markets are characterized by lots of indistinguishable firms producing a homogeneous product. Very few markets in the U.S. are perfectly competitive.
- 16. Economists assume firms wish to maximize economic profit, and that individuals and households wish to maximize utility.
