

## RENAME

---

```
RENAME old TSP variable new TSP variable ;
```

---

### Function:

RENAME changes the name of an old TSP variable (series, matrix, constant, etc.).

### Examples:

Save the coefficients from a regression in the vector B1. Note: this is more efficient than COPY, if there is no reason to save the original @COEF.

```
OLSQ Y C X;  
RENAME @COEF B1;
```

### Output:

The name of the variable is changed. If a variable already exists with the new name, it is deleted.
