- last year's exam posted ≈ Sunday
- Zoom details for next week later today

How Might This Matter

$c_{t+1} = b_{11} c_t + b_{12} k_t$

$k_{t+1} = b_{21} c_t + b_{22} k_t \quad \forall t$

- Why does diagonalizability matter?

  Consider a two-dimensional linear difference equation:

$$\begin{pmatrix} c_{t+1} \\ k_{t+1} \end{pmatrix} = \begin{pmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{pmatrix} \begin{pmatrix} c_t \\ k_t \end{pmatrix} \quad \forall t = 0, 1, 2, 3, \ldots$$

  given an initial condition c_0, k_0, or, setting

$$y_t = \begin{pmatrix} c_t \\ k_t \end{pmatrix} \quad \forall t \quad \text{and} \quad B = \begin{pmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{pmatrix}$$

  we can rewrite this more compactly as

$$y_{t+1} = B y_t \quad \forall t$$

  where $b_{ij} \in \mathbf{R}$ each i, j.

We want to find a solution y_t, $t = 1, 2, 3, \ldots$ given initial condition y_0. (Why?)

Such a dynamical system will arise for example as a characterization of the solution to a standard infinite-horizon optimal growth problem (202a, lecture 2).

If B is diagonalizable, this can be easily solved after a change of basis. If B is diagonalizable, choose an invertible 2×2 real matrix P such that

$$P^{-1}BP = D = \begin{pmatrix} d_1 & 0 \\ 0 & d_2 \end{pmatrix}$$

Then

$$\begin{aligned} y_{t+1} = By_t \quad \forall t &\iff P^{-1}y_{t+1} = P^{-1}By_t \quad \forall t \qquad \text{(mult. by } P^{-1}\text{)} \\ &\iff (P^{-1}y_{t+1}) = (P^{-1}BP)(P^{-1}y_t) \quad \forall t \qquad PP^{-1} = I \\ &\iff \bar{y}_{t+1} = D\bar{y}_t \quad \forall t \end{aligned}$$

$$= \begin{pmatrix} d_1 & 0 \\ 0 & d_2 \end{pmatrix} \bar{y}_t$$

where $\bar{y}_t = P^{-1}y_t \ \forall t$

$\Leftrightarrow \quad \bar{y}_{i,t+1} = d_i \bar{y}_{it} \quad \forall t \;, \; i = 1, 2$

where $\bar{y}_t = P^{-1} y_t \ \forall t$.

Since D is diagonal, after a change of basis to $\bar{y}_t$, we need to solve two **independent** linear univariate difference equations, which is easy:

$$\bar{y}_{it} = d_i^t \bar{y}_{i0} \quad \forall t \qquad\qquad i = 1, 2$$

- Not all real $n \times n$ matrices are diagonalizable (not even all invertible $n \times n$ matrices are)...so can we identify some classes that are? yesterday:
  - basis of eigenvectors ($\Leftrightarrow$)
  - n distinct eigenvalues ($\Rightarrow$)
- Some types of matrices appear more frequently than others – especially real symmetric $n \times n$ matrices (matrix representation of second derivatives of C^2 functions, quadratic forms...). e.g. second order conditions in optimization, checking concavity and convexity, Taylor series approximation of function

- Recall that an $n \times n$ real matrix A is *symmetric* if $a_{ij} = a_{ji}$ for all i, j, where a_{ij} is the $(i, j)^{\text{th}}$ entry of A.

Rest of this section: work in $\mathbb{R}^n$
- vector space
- norm
- inner product $\left(x \cdot y = \sum_{i=1}^{n} x_i y_i\right)$

Orthonormal Bases

Definition 1. *Let*

$$\delta_{ij} = \begin{cases} 1 & \text{if } i = j \\ 0 & \text{if } i \neq j \end{cases}$$

A basis $V = \{v_1, \ldots, v_n\}$ *of* $\mathbf{R}^n$ *is* orthonormal *if* $v_i \cdot v_j = \delta_{ij}$. $= \begin{cases} 1 & i = j \\ 0 & i \neq j \end{cases}$

In other words, a basis is orthonormal if each basis element has unit length ($\|v_i\|^2 = v_i \cdot v_i = 1 \ \forall i$), and distinct basis elements are perpendicular ($v_i \cdot v_j = 0$ for $i \neq j$).

$$\|x\| = \left(\sum_{i=1}^{n} x_i^2\right)^{1/2} = (x \cdot x)^{1/2}$$

Orthonormal Bases

Remark: Suppose that $x = \sum_{j=1}^{n} \alpha_j v_j$ where $\{v_1, \ldots, v_n\}$ is an orthonormal basis of $\mathbf{R}^n$. Then

$$\begin{aligned} x \cdot v_k &= \left(\sum_{j=1}^{n} \alpha_j v_j \right) \cdot v_k \\ &= \sum_{j=1}^{n} \alpha_j (v_j \cdot v_k) \\ &= \sum_{j=1}^{n} \alpha_j \delta_{jk} \qquad = \begin{cases} 1 & j = k \\ 0 & j \neq k \end{cases} \\ &= \alpha_k \end{aligned}$$

so

$$x = \sum_{j=1}^{n} (x \cdot v_j) v_j$$

Orthonormal Bases

Example: The standard basis of $\mathbf{R}^n$ is orthonormal.

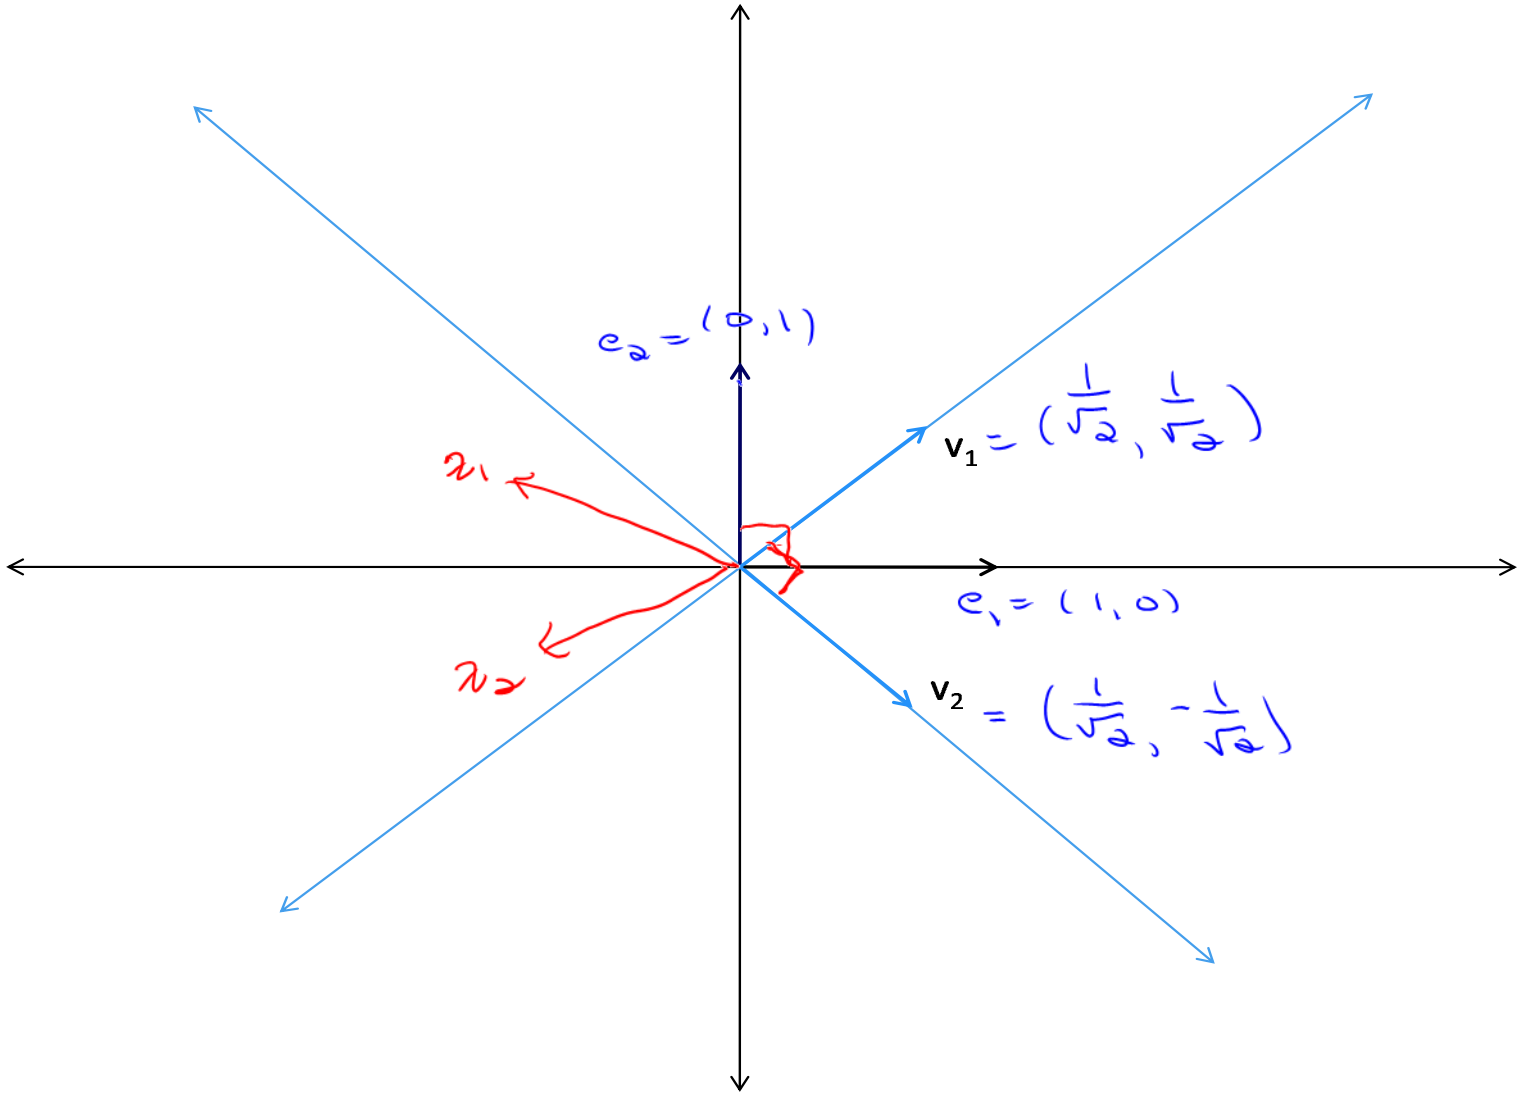
$e_i = (0, \ldots, 1, 0, \ldots, 0) \qquad i = 1, \ldots, n$

(Why?)

e.g. $\mathbb{R}^2$: $e_1 = (1, 0)$, $e_2 = (0, 1)$

others? e.g. $v_1 = \left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$, $v_2 = \left(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$

also many bases that are <u>not</u> orthonormal



$e_2 = (0, 1)$
$v_1 = \left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$
z_1
$e_1 = (1, 0)$
z_2
$v_2 = \left(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$

Unitary Matrices

Recall that for a real $n \times m$ matrix A, $A^\top$ denotes the transpose of A: the $(i,j)^{th}$ entry of $A^\top$ is the $(j,i)^{th}$ entry of A.

So the i^{th} row of $A^\top$ is the i^{th} column of A.

Definition 2. *A real $n \times n$ matrix A is* unitary *if $A^\top = A^{-1}$.*

Notice that by definition every unitary matrix is invertible.

Unitary Matrices

Theorem 1. *A real $n \times n$ matrix A is unitary if and only if the columns of A are orthonormal.*

Proof. Let v_j denote the j^{th} column of A.

$$\begin{aligned} A^\top = A^{-1} &\iff A^\top A = I \\ &\iff v_i \cdot v_j = \delta_{ij} \quad \forall i, j \\ &\iff \{v_1, \ldots, v_n\} \text{ is orthonormal} \end{aligned}$$

$= (\delta_{ij}) = \begin{cases} 1 & i = j \\ 0 & i \neq j \end{cases}$

□

$A = (v_1 \ \cdots \ v_n) = Mtx_{W,V}(id)$

$crd_W(v_1) \ \cdots \ crd_W(v_n)$

$(1, 2) = 1 \cdot (1, 0) + 2 \cdot (0, 1)$

$= crd_W((1, 2))$

Unitary Matrices

$= \{v_1, \ldots, v_n\}$

If A is unitary, let V be the set of columns of A and W be the standard basis of $\mathbf{R}^n$. Since A is unitary, it is invertible, so V is a basis of $\mathbf{R}^n$. ($\{v_1, \ldots, v_n\}$ linearly independent)

$$A^\top = A^{-1} = Mtx_{V,W}(id) = \text{change of basis from } W \text{ to } V$$

W: standard basis

Since V is orthonormal, the transformation between bases W and V preserves all geometry, including lengths and angles.

Thm: Let C be an $n \times n$ real symmetric matrix. Then C is diagonalizable. In addition,

$$C = P^{-1} D P$$

where D is a diagonal matrix and P is unitary.

Note:
- The diagonal elements $\{\lambda_1, \dots, \lambda_n\}$ of D are the eigenvalues of C
- C has orthonormal eigenvectors $\{v_1, \dots, v_n\}$ that are a basis for $\mathbb{R}^n$.

Diagonalization of Real Symmetric Matrices

Theorem 2. *Let $T \in L(\mathbf{R}^n, \mathbf{R}^n)$ and W be the standard basis of $\mathbf{R}^n$. Suppose that $Mtx_W(T)$ is symmetric. Then the eigenvectors of T are all real, and there is an orthonormal basis $V = \{v_1, \ldots, v_n\}$ of $\mathbf{R}^n$ consisting of eigenvectors of T, so that $Mtx_W(T)$ is diagonalizable:*

$$Mtx_W(T) = Mtx_{W,V}(id) \cdot Mtx_V(T) \cdot Mtx_{V,W}(id)$$

where $Mtx_V T$ is diagonal and the change of basis matrices $Mtx_{V,W}(id)$ and $Mtx_{W,V}(id)$ are unitary.

The proof of the theorem requires a lengthy digression into the linear algebra of *complex* vector spaces. A brief outline is in the notes.

quadratic form : polynomial with all terms of degree 2

Quadratic Forms

Example: Let $f : \mathbb{R}^2 \to \mathbb{R}$

$$f(x) = \alpha x_1^2 + \beta x_1 x_2 + \gamma x_2^2$$

Let write as $f(x) = x^T A x$, A symmetric

$$A = \begin{pmatrix} \alpha & \frac{\beta}{2} \\ \frac{\beta}{2} & \gamma \end{pmatrix}$$

$$x^T A x = \begin{pmatrix} x_1 & x_2 \end{pmatrix} \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}$$

so A is symmetric and

$$\begin{aligned} x^\top Ax &= (x_1, x_2) \begin{pmatrix} \alpha & \frac{\beta}{2} \\ \frac{\beta}{2} & \gamma \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \\ &= (x_1, x_2) \begin{pmatrix} \alpha x_1 + \frac{\beta}{2} x_2 \\ \frac{\beta}{2} x_1 + \gamma x_2 \end{pmatrix} \\ &= \alpha x_1^2 + \beta x_1 x_2 + \gamma x_2^2 \\ &= f(x) \end{aligned}$$

Notice $f(0) = 0$.

Can we determine anything about $f(x)$ for $x \neq 0$?

e.g. $f(x) \geq 0 \quad \forall x$?

easy if $\beta = 0$ ...

Quadratic Forms

general form:

Consider a quadratic form

$$f(x_1, \ldots, x_n) = \sum_{i=1}^{n} \alpha_{ii} x_i^2 + \sum_{i<j} \beta_{ij} x_i x_j \qquad (1)$$

Let

$$\alpha_{ij} = \begin{cases} \frac{\beta_{ij}}{2} & \text{if } i < j \\ \frac{\beta_{ji}}{2} & \text{if } i > j \end{cases}$$

above diagonal

below diagonal

Let

$$A = \begin{pmatrix} \alpha_{11} & \cdots & \alpha_{1n} \\ \vdots & \ddots & \vdots \\ \alpha_{n1} & \cdots & \alpha_{nn} \end{pmatrix} \text{ so } f(x) = x^\top A x$$

real symmetric

Quadratic Forms

A is symmetric, so let $V = \{v_1, \ldots, v_n\}$ be an orthonormal basis of eigenvectors of A with corresponding eigenvalues $\lambda_1, \ldots, \lambda_n$.

$$\text{Then } A = U^\top D U$$

$$\text{where } D = \begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_n \end{pmatrix}$$

$$\text{and } U = Mtx_{V,W}(id) \text{ is unitary}$$

The columns of $U^\top$ (the rows of U) are the coordinates of $v_1, \ldots, v_n$, expressed in terms of the standard basis W. Given $x \in \mathbf{R}^n$, recall

$$x = \sum_{i=1}^{n} \gamma_i v_i \text{ where } \gamma_i = x \cdot v_i$$

Quadratic Forms

So

$$
\begin{aligned}
f(\gamma) = f(x) &= f\left(\sum \gamma_i v_i\right) \\
&= \left(\sum \gamma_i v_i\right)^\top A \left(\sum \gamma_i v_i\right) \quad = x^T A x \\
&= \left(\sum \gamma_i v_i\right)^\top U^\top D U \left(\sum \gamma_i v_i\right) \\
&= \left(U \sum \gamma_i v_i\right)^\top D \left(U \sum \gamma_i v_i\right) \qquad ((EF)^T = F^T E^T) \\
&= \left(\sum \gamma_i U v_i\right)^\top D \left(\sum \gamma_i U v_i\right) \qquad (U \text{ linear}) \\
&= (\gamma_1, \ldots, \gamma_n) D \begin{pmatrix} \gamma_1 \\ \vdots \\ \gamma_n \end{pmatrix} \leftarrow U \text{ is change of basis matrix from } W \text{ to } V \\
&= \sum \lambda_i \gamma_i^2 \qquad \Rightarrow U v_i = e_i \ \forall i
\end{aligned}
$$

↑ eigenvalues of A

Quadratic Forms

The equation for a level set of f is

$$\{\gamma \in \mathbb{R}^n : f(\gamma) = C\} = \left\{\gamma \in \mathbf{R}^n : \sum_{i=1}^{n} \lambda_i \gamma_i^2 = C\right\} \qquad C \in \mathbb{R}$$

- If $\lambda_i \geq 0$ for all i, the level set is an ellipsoid, with principal axes in the directions $v_1, \ldots, v_n$. The length of the principal axis along v_i is $\sqrt{C/\lambda_i}$ if $C \geq 0$ (if $\lambda_i = 0$, the level set is a degenerate ellipsoid with principal axis of infinite length in that direction). The level set is empty if $C < 0$.

  $\Rightarrow$ f has global min at 0, $f(x) \geq 0$ $\forall x$

- If $\lambda_i \leq 0$ for all i, the level set is an ellipsoid, with principal axes in the directions $v_1, \ldots, v_n$. The length of the principal

  $\Rightarrow$ f has global max at 0, $f(x) \leq 0$ $\forall x$

axis along v_i is $\sqrt{C/\lambda_i}$ if $C \leq 0$ (if $\lambda_i = 0$, the level set is a degenerate ellipsoid with principal axis of infinite length in that direction). The level set is empty if $C > 0$.

- If $\lambda_i > 0$ for some i and $\lambda_j < 0$ for some j, the level set is a hyperboloid. For example, suppose $n = 2$, $\lambda_1 > 0$, $\lambda_2 < 0$. The equation is

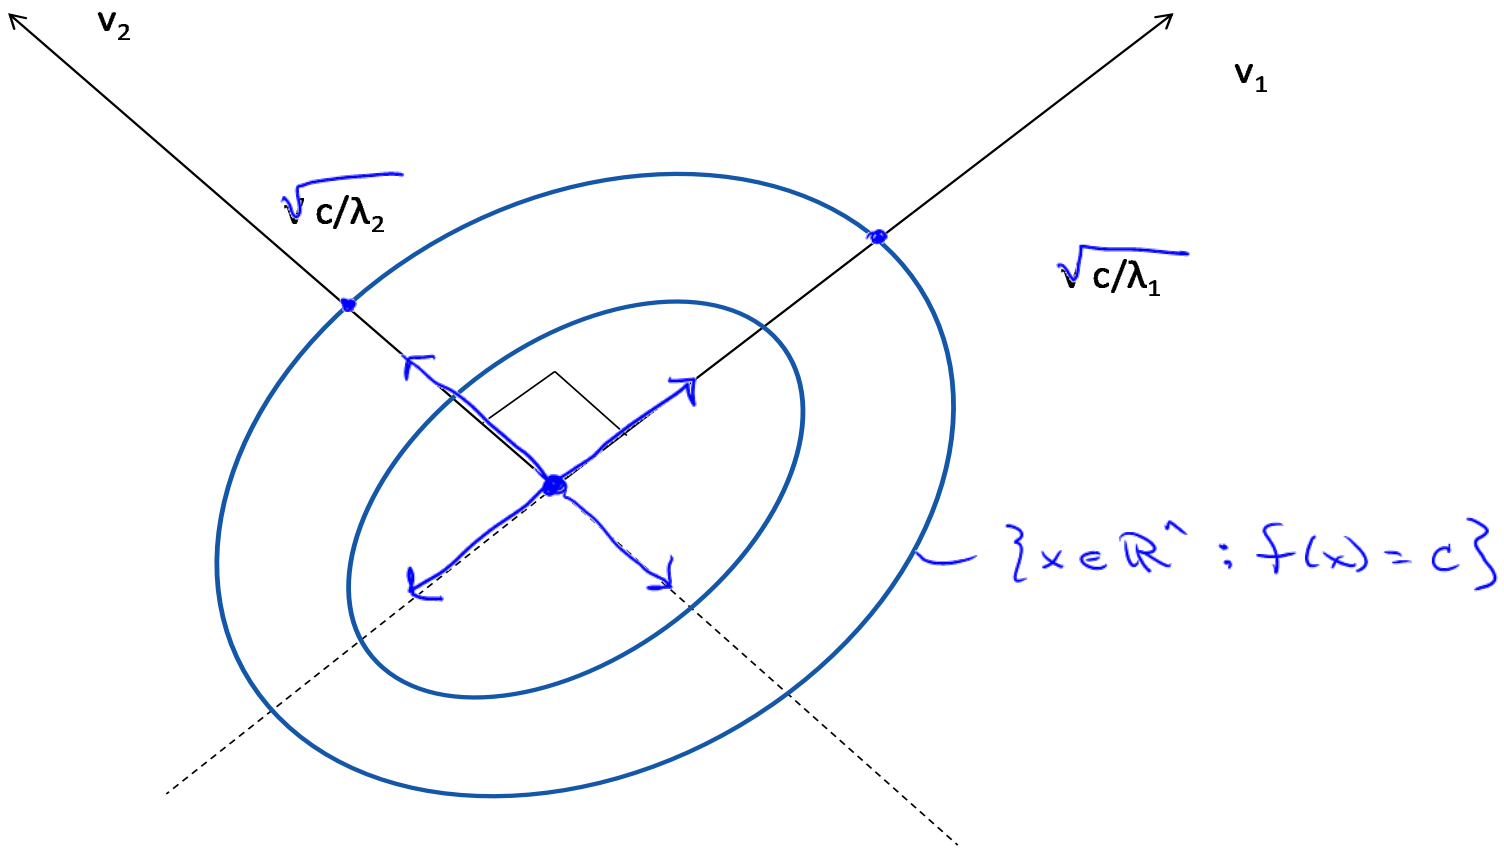
$$\begin{aligned} C &= \lambda_1 \gamma_1^2 + \lambda_2 \gamma_2^2 \\ &= \left(\sqrt{\lambda_1}\gamma_1 + \sqrt{|\lambda_2|}\gamma_2\right)\left(\sqrt{\lambda_1}\gamma_1 - \sqrt{|\lambda_2|}\gamma_2\right) \end{aligned}$$

$\Rightarrow$ f has a saddle point at 0
min with respect to v_i
max with respect to v_j

This is a hyperbola with asymptotes

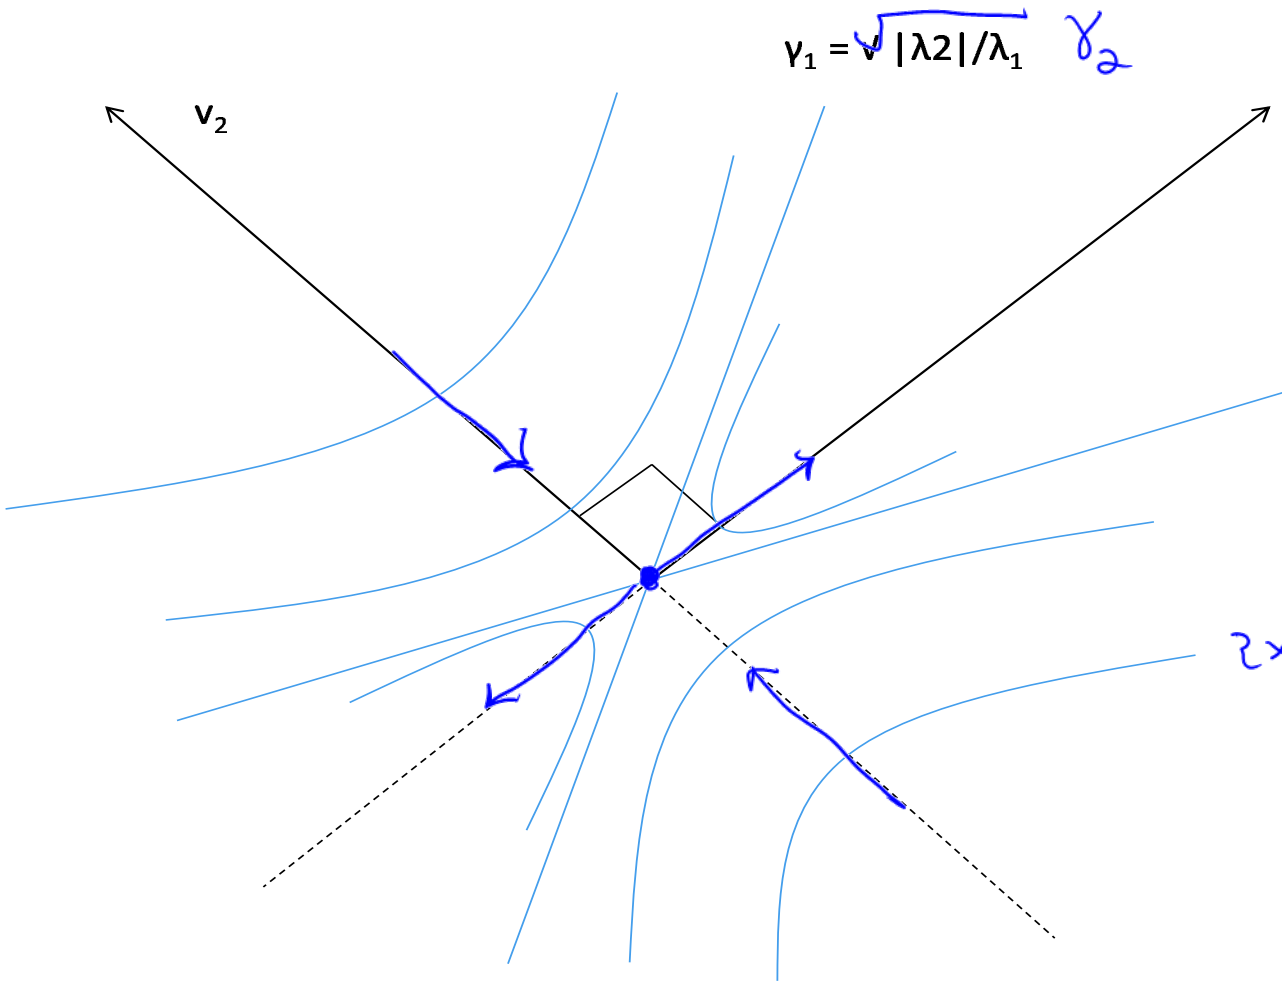
$$\begin{aligned} 0 &= \sqrt{\lambda_1}\gamma_1 + \sqrt{|\lambda_2|}\gamma_2 \\ \Rightarrow \gamma_1 &= -\sqrt{\frac{|\lambda_2|}{\lambda_1}}\gamma_2 \\ 0 &= \left(\sqrt{\lambda_1}\gamma_1 - \sqrt{|\lambda_2|}\gamma_2\right) \\ \Rightarrow \gamma_1 &= \sqrt{\frac{|\lambda_2|}{\lambda_1}}\gamma_2 \end{aligned}$$

$\lambda_1 > 0, \lambda_2 > 0$



f has a global min at 0

$\lambda_1 > 0, \lambda_2 < 0$



f has a saddle point at 0

Quadratic Forms

$f(x) = x^T A x$

This proves the following corollary of Theorem 2.

Corollary 1. *Consider the quadratic form (1).* Let $\{v_1, \ldots, v_n\}$ be an orthonormal basis of eigenvectors of A with corresponding eigenvalues $\{\lambda_1, \ldots, \lambda_n\}$

1. *f has a global minimum at 0 if and only if $\lambda_i \geq 0$ for all i; the level sets of f are ellipsoids with principal axes aligned with the orthonormal eigenvectors $v_1, \ldots, v_n$.*

2. *f has a global maximum at 0 if and only if $\lambda_i \leq 0$ for all i; the level sets of f are ellipsoids with principal axes aligned with the orthonormal eigenvectors $v_1, \ldots, v_n$.*

3. *If $\lambda_i < 0$ for some i and $\lambda_j > 0$ for some j, then f has a saddle point at 0; the level sets of f are hyperboloids with principal axes aligned with the orthonormal eigenvectors $v_1, \ldots, v_n$.*

Bounded Linear Maps

(over $\mathbb{R}$)

Definition 3. *Suppose X, Y are normed vector spaces and $T \in L(X, Y)$. We say T is* bounded *if*

$$\exists \beta \in \mathbf{R} \text{ s.t. } \quad \|T(x)\|_Y \leq \beta \|x\|_X \quad \forall x \in X$$

Note this implies that T is Lipschitz with constant β.

why not previous notion of bounded:

$\exists B \in \mathbb{R}$ s.t. $\|T(x)\| \leq B \ \forall x$??

$T(\alpha x) = \alpha T(x) \quad \forall \alpha \in \mathbb{R}$

$\|T(\alpha x)\| = \|\alpha T(x)\| = |\alpha| \, \|T(x)\|$

Bounded Linear Maps

Much more is true:

Theorem 3 (Thms. 4.1, 4.3)**.** *Let X and Y be normed vector spaces and $T \in L(X, Y)$. Then*

$$\begin{aligned} &T \text{ is continuous at some point } x_0 \in X \\ \iff\ &T \text{ is continuous at every } x \in X \\ \iff\ &T \text{ is uniformly continuous on } X \\ \iff\ &T \text{ is Lipschitz} \\ \iff\ &T \text{ is bounded} \end{aligned}$$

Proof. Suppose T is continuous at x_0. Fix $\varepsilon > 0$. Then there exists $\delta > 0$ such that

$$\|z - x_0\| < \delta \Rightarrow \|T(z) - T(x_0)\| < \varepsilon$$

Now suppose x is any element of X. If $\|y - x\| < \delta$, let $z = y - x + x_0$, so $\|z - x_0\| = \|y - x\| < \delta$.

$$\begin{aligned} & \|T(y) - T(x)\| \\ = \; & \|T(y - x)\| \qquad (T \text{ linear}) \\ = \; & \|T(y - x + x_0 - x_0))\| \qquad = \|T(z - x_0)\| \\ = \; & \|T(z) - T(x_0)\| \qquad (T \text{ linear}) \\ < \; & \varepsilon \end{aligned}$$

which proves that T is continuous at every x, and uniformly continuous.

We claim that T is bounded if and only if T is continuous at 0. Suppose T is not bounded. Then

$$\exists \{x_n\} \text{ s.t. } \quad \|T(x_n)\| > n\|x_n\| \quad \forall n$$

Note that $x_n \neq 0$. Let $\varepsilon = 1$. Fix $\delta > 0$ and choose n such that $\frac{1}{n} < \delta$. Let

$$
\begin{aligned}
x_n' &= \frac{x_n}{n\|x_n\|} \\
\|x_n'\| &= \frac{\|x_n\|}{n\|x_n\|} \\
&= \frac{1}{n} \\
&< \delta \\
\|T(x_n') - T(0)\| &= \|T(x_n')\| \\
&= \frac{1}{n\|x_n\|}\|T(x_n)\| \\
&> \frac{n\|x_n\|}{n\|x_n\|} \\
&= 1 \\
&= \varepsilon
\end{aligned}
$$

Since this is true for every δ, T is not continuous at 0. Therefore, T continuous at 0 implies T is bounded. Now, suppose T is bounded, so find $M > 0$ such that $\|T(x)\| \leq M\|x\|$ for every $x \in X$. Given $\varepsilon > 0$, let $\delta = \varepsilon/M$. Then

$$\begin{aligned} \|x - 0\| < \delta &\Rightarrow \|x\| < \delta \\ &\Rightarrow \|T(x) - T(0)\| = \|T(x)\| < M\delta \quad \text{(def of } M\text{)} \\ &\Rightarrow \|T(x) - T(0)\| < \varepsilon \quad = M\delta \end{aligned}$$

so T is continuous at 0.

Thus, we have shown that continuity at some point x_0 implies uniform continuity, which implies continuity at every point, which implies T is continuous at 0, which implies that T is bounded, which implies that T is continuous at 0, which implies that T is

continuous at some x_0, so all of the statements except possibly the Lipschitz statement are equivalent.

Suppose T is bounded, with constant M. Then

$$\begin{aligned} \|T(x) - T(y)\| &= \|T(x-y)\| \\ &\leq M\|x-y\| \end{aligned}$$

so T is Lipschitz with constant M; conversely, if T is Lipschitz with constant M, then T is bounded with constant M. So all the statements are equivalent. □

c_{00} - sequences of real numbers with finitely many entries $\neq 0$

Bounded Linear Maps

Every linear map on a finite-dimensional normed vector space is bounded (and thus continuous, uniformly continuous, and Lipschitz continuous).

Theorem 4 (Thm. 4.5)**.** *Let X and Y be normed vector spaces, with* $\dim X = n$*. Every $T \in L(X, Y)$ is bounded.*

($n \in \mathbb{N}$)

Proof. See de la Fuente. □

$T: c_{00} \to c_{00}$ $\quad \|x\| = \sup_n |x_n|$

$T(x_1, x_2, \ldots) = (x_1, 2x_2, 3x_3, \ldots)$

$y^n = (1, 1, 1, \ldots, 1, 0, 0, \ldots)$ $\quad \|y^n\| = 1$ $\forall n$

$T(y^n) = (1, 2, 3, \ldots, n, 0, \ldots 0)$

$\|T(y^n)\| = n \to \infty$ as $n \to \infty$

Topological Isomorphism

Definition 4. *A* topological isomorphism *between normed vector spaces X and Y is a linear transformation $T \in L(X, Y)$ that is invertible (one-to-one, onto), continuous, and has a continuous inverse.*

Two normed vector spaces X and Y are topologically isomorphic *if there is a topological isomorphism $T : X \to Y$.*

$\|f(x)-f(y)\| \le \|Df(x)\|\,\|x-y\|$

The Space $B(X,Y)$

$\Rightarrow \exists\, \beta > 0$ s.t. $\|T(x)\| \le \beta \|x\|$ $\forall x$

$\Rightarrow \dfrac{\|T(x)\|}{\|x\|} \le \beta$ $\forall x \neq 0$

Suppose X and Y are normed vector spaces. We define

$$\begin{aligned} B(X,Y) &= \{T \in L(X,Y) : T \text{ is bounded}\} \\ \text{Define}: \quad \|T\|_{B(X,Y)} &= \sup\left\{\frac{\|T(x)\|_Y}{\|x\|_X} : x \in X, x \neq 0\right\} \\ &= \sup\{\|T(x)\|_Y : \|x\|_X = 1\} \end{aligned}$$

$\Rightarrow \quad \|T(x)\| \le \|T\|\,\|x\| \quad \forall x \in X$ by definition

We skip the proofs of the rest of these results – read dIF.

$$\frac{\|T(x)\|}{\|x\|} = \frac{1}{\|x\|}\|T(x)\| = \left\|\frac{1}{\|x\|}T(x)\right\| = \left\|T\left(\frac{x}{\|x\|}\right)\right\|$$

$$= \sup\left\{ \| T\left(\frac{x}{\|x\|}\right) \| : x \in X,\ x \neq 0 \right\}$$

$x \neq 0$, $y = \frac{x}{\|x\|} = \frac{1}{\|x\|} x \iff \|y\| = 1$, $y \in X$

$$= \sup\left\{ \|T(y)\| : y = \frac{1}{\|x\|} x,\ x \in X,\ x \neq 0 \right\}$$

$$\|y\| = \left\| \frac{1}{\|x\|} x \right\| = \frac{1}{\|x\|} \|x\| = 1$$

The Space $B(X, Y)$

Theorem 5 (Thm. 4.8)**.** *Let X, Y be normed vector spaces. Then*

$$\left(B(X,Y), \|\cdot\|_{B(X,Y)}\right)$$

is a normed vector space.

The Space $B(\mathbf{R}^n, \mathbf{R}^m)$

Theorem 6 (Thm. 4.9)**.** *Let $T \in L(\mathbf{R}^n, \mathbf{R}^m)$ $(= B(\mathbf{R}^n, \mathbf{R}^m))$ with matrix $A = (a_{ij})$ with respect to the standard bases. Let*

$$M = \max\{|a_{ij}| : 1 \leq i \leq m, 1 \leq j \leq n\}$$

Then

$$M \leq \|T\| \leq M\sqrt{mn}$$

.

Compositions

Theorem 7 (Thm. 4.10)**.** *Let $R \in L(\mathbf{R}^m, \mathbf{R}^n)$ and $S \in L(\mathbf{R}^n, \mathbf{R}^p)$. Then*

$$\|S \circ R\| \leq \|S\|\|R\|$$

$\ker T = \{0\} \iff T$ 1-1

Invertibility

Define $\Omega(\mathbf{R}^n) = \{T \in L(\mathbf{R}^n, \mathbf{R}^n) : T \text{ is invertible}\}$

Theorem 8 (Thm. 4.11'). *Suppose $T \in L(\mathbf{R}^n, \mathbf{R}^n)$ and E is the standard basis of $\mathbf{R}^n$. Then*

T is invertible } nice exercise

$\iff \ker T = \{0\}$

$\iff \det\left(Mtx_E(T)\right) \neq 0$

$\iff \det\left(Mtx_{V,V}(T)\right) \neq 0$ *for every basis V*

$\iff \det\left(Mtx_{V,W}(T)\right) \neq 0$ *for every pair of bases V, W*

Invertibility

Theorem 9 (Thm. 4.12)**.** *If* $S, T \in \Omega(\mathbf{R}^n)$*, then* $S \circ T \in \Omega(\mathbf{R}^n)$ *and*

$$(S \circ T)^{-1} = T^{-1} \circ S^{-1}$$

Invertibility

Theorem 10 (Thm. 4.14)**.** *Let $S, T \in L(\mathbf{R}^n, \mathbf{R}^n)$. If T is invertible and*

$$\|T - S\| < \frac{1}{\|T^{-1}\|}$$

then S is invertible. In particular, $\Omega(\mathbf{R}^n)$ is open in $L(\mathbf{R}^n, \mathbf{R}^n) = B(\mathbf{R}^n, \mathbf{R}^n)$.

Theorem 11 (Thm. 4.15)**.** *The function $(\cdot)^{-1} : \Omega(\mathbf{R}^n) \to \Omega(\mathbf{R}^n)$ that assigns T^{-1} to each $T \in \Omega(\mathbf{R}^n)$ is continuous.*

$\{x_n\}$ Cauchy

$$\sup \{ d(x_k, x_n) : k \geq n \}$$

$$d(x_m, x_n) = \sum_t \beta^{-t} \rho(x_{m_t}, x_{n_t}) < \varepsilon$$

$$\Rightarrow \beta^{-t} \rho(x_{m_t}, x_{n_t}) < \varepsilon \quad \forall t$$

$\{x_{n_t}\} \subseteq \mathbb{R}$ is Cauchy $\forall t$

$$x \in [0,1]^\omega$$

$$d(x,y) = \sum_t \beta^{-t} \rho(x_t, y_t)$$

$$x_t \in [0,1]$$

$$\forall \varepsilon > 0 \quad \exists T \quad \text{s.t.} \quad \sum_{t=T}^{\infty} \beta^{-t} < \varepsilon$$
