#### OUTLINE — December 5, 2018

#### Review of Material

- Order of file is
  - Micro (pp. 3 34)
  - Then macro (pp. 35 end)
- More slides here than we can cover in 50 minutes
- I will pick and choose which slides to cover on 12/5
   Bring your clickers to help my decision making

#### Review PPF Macro definitions: GDP, . Economic Growth Unemployment, Inflation Gains from Trade Keynesian Model Supply & Demand • Y = C + I + G + EX - IM Elasticity Spending Multipliers . Consumer & Producer Investment . Surplus **Fiscal Policy** . Profit-Maximization International finance Market Failure Phillips Curve Externalities Inflation & the Fed Monopoly & Monopolistic Competition Monetary policy

- Asymmetric Information
- Distribution

# **Overarching Concepts**

- Counterfactual
  - To properly evaluate effect of policy, don't compare the policy's results across time because factors other than the policy could have changed, too.
  - Compare the policy's results (eg, today's economy) with what the same time period would have hypothetically have been like without the policy in effect (eg, today without the policy, which is "the counterfactual")

#### Production Possibilities Frontier · General characteristics of possible combinations of output that an economy can produce Simplification: 2 types of . output Key assumption: No . deliberate waste Implication: no unemployment when on PPF "On PPF" is equivalent to full employment economy Related to "potential output"

How can we consume beyond PPF?		
<ul> <li>[1] Economic Growth</li> <li>Sources of growth         <ul> <li>more resources</li> <li>greater productivity</li> </ul> </li> <li>Shifts out PPF</li> </ul>	<ul> <li>[2] Specialization <u>&amp; Trade</u></li> <li>Comparative advantage</li> <li>Allows consumption beyond PPF but doesn't shift PPF</li> </ul>	<ul> <li>Aid</li> <li>Allows consumption beyond PPF but doesn't shift PPF</li> </ul>

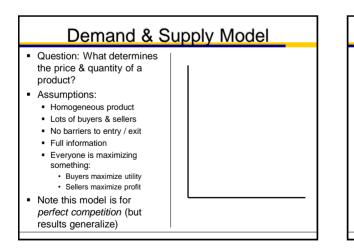

r

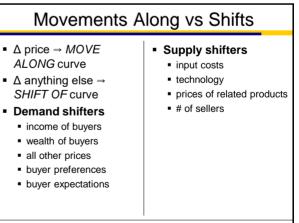

#### Long-run economic growth

- Productivity increases with improvements in
  - Education

٦

- Research and Development
- Financial Institutions
- Transportation Networks
- Political Institutions
- Property Rights
- Judicial System

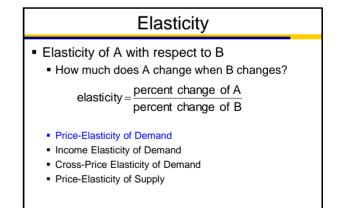

# **Consumer & Producer Surplus**

- Consumer Surplus compares
- Producer Surplus compares
- What we are willing to payWhat we actually pay
- Minimum price sellers are willing to accept
- Price sellers actually receive
- When price is determined by the market, surplus is maximized
  Loss of surplus when there's a market intervention called "deadweight loss"
  - Occurs with price ceilings, price floors, excise taxes

# Price Ceilings & Floors Ceiling max price allowed Binds if p\* > p ceiling Floor Min price allowed Binds if p\* Need non-price mechanism to determine buyers (ceiling) or sellers (floor)

# Burden of a Tax

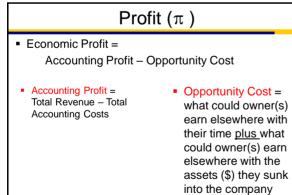

- Sales or excise tax on an item increases its price
  - But not by the full amount of the tax
- Who "bears the burden" of the tax?
  - Burden = (△price paid or retained) / tax
  - Buyers' Burden (P<sub>2</sub> P<sub>1</sub>)/T = % of tax buyers pay
  - Sellers' Burden (P<sub>1</sub> - (P<sub>2</sub> - T))/T = % of tax sellers pay

Price Elasticity of Demand	
Determinants Availability of Substitutes Share of Total Spending Time Horizon	<ul> <li>Total Revenue Effect</li> <li>What happens to TR when price rises?</li> <li>Price-Elastic</li> <li>Price-Inelastic</li> <li>Unitary Price Elasticity</li> </ul>

#### Marginal benefit vs marginal cost

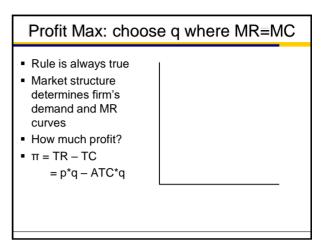

- Compare marginal benefit & marginal cost
   Ignore "sunk costs"
- MB > MC: do it
- MB < MC: don't do it</p>
- MB = MC: that's the best you can do
- Profit Max: choose q where MR=MC

Long Run	Short Run
<ul> <li>Technique can be changed</li> <li>Entry &amp; exit are possible</li> <li>Decision</li> <li>Stay in Industry</li> </ul>	<ul> <li>Technique is fixed</li> <li>Entry &amp; exit are impossible</li> <li>Decision (if planning to exit)</li> <li>Decision (if planning to stay, or if not shutting down): how much to produce?</li> </ul>

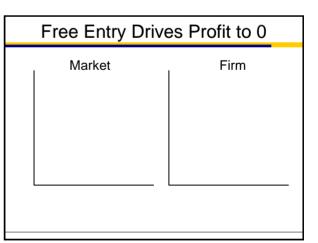

#### Law of Diminishing Returns

- As quantity of variable input (labor) increases, all else constant, <u>marginal</u> product decreases (=diminishes)
- Implication
  - To increase output by constant amount requires ever more variable input (labor)
- And implication of that . . .
  - · Marginal cost increases as amount of output increases

# Long-run & Short-run & profit

- Short-run  $\pi > 0$  ? Firms enter industry *in the long run*
- Short-run  $\pi < 0$  ? Some firms exit industry in the long run
- If  $\pi < 0$  & firm will exit in the long run, what about short run?
  - If revenue > variable costs, then produce in SR
    - · Firm is covering all its variable costs, and more
  - If revenue < variable costs, then shut down in SR</li>
     Firm loses less by just paying fixed costs
- Supply curve is MC curve above minimum Average Variable Cost

5

# Definitions of Wealth & Income

#### Wealth (or, Net Worth)

#### = Assets - Liabilities

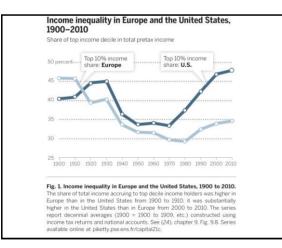

- Assets: what you own
   Real Assets
  - Financial Assets
- Liabilities: what you
- owe to others
- Evaluated as of a particular date (e.g., as of today)

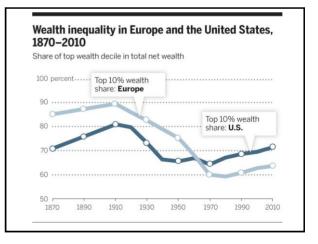

#### Income

- What you receive
- Evaluated <u>over</u> a period
- of time (e.g., per year) Sources of Income
  - Labor income
  - · Property income
  - Transfer payments

#### **Distribution of Income**

- Gini Coefficient: A measure of evenness of distribution
  - Gini = 0 means perfectly equal distribution
  - Gini = 1 means perfectly <u>un</u>equal distribution
- Income = what we earn annually
  - Includes labor income & property income
- Income inequality is as high (bad) today as in 1920s
  - Somewhat due to property income
  - But largely due to inequality in labor income

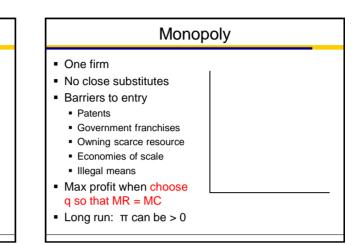

6

# "Market Failure"

- If any of these assumptions isn't satisfied...
  - perfect competition
  - profit maximization
  - utility maximization
  - private property rights
  - full information
- ...then markets "fail" . . .
  - . . . to produce  $q^*$  where p = MC

# Monopolistic Competition

- Lots of firms
- No barriers to entry/exit
- Heterogeneous product
- Max profit when choose q so that MR = MC
- Long Run: profit = 0

# Comparing Industry Forms

	Short Run	Transition	Long Run
Perfect Competition	π > 0	Entry (个S)	$\pi = 0$
	$\pi = 0$	No change	$\pi = 0$
	π < 0	Exit (↓S)	$\pi = 0$
Monopolistic Competition	π > 0	Entry (↓D)	$\pi = 0$
	$\pi = 0$	No change	$\pi = 0$
	π < 0	Exit (个D)	$\pi = 0$
	π > 0	No change	π > 0
Monopoly	$\pi = 0$	No change	$\pi = 0$
	π < 0	Exit	

Extern	alities	Internalizing	Externalities
<ul> <li>Your activity affects someone else</li> <li>Negative externality <ul> <li>Cost borne by someone else</li> </ul> </li> <li>Positive externality</li> </ul>	Coase Theorem:     Government intervention required to move market to social optimum unless     Well-defined property rights     No costs to bargaining     Only a few people	<ul> <li>People have no incentive to take external benefit or cost into account</li> <li>So private optimum differs from social optimum</li> </ul>	<ul> <li>But if government can change the private costs that they include the external cost (or benefit), then the private optimum can become equal to the social optimum</li> </ul>
Benefit received by someone else	<ul> <li>Otherwise: government intervention</li> </ul>	<u>If</u> government implements a tax cost, <u>then</u> private market produc Tax too small → market equilibrium Tax too big → market equilibrium q (Pos externality): If government implem external benefit, then private market pr	ces socially optimal quantity quantity > socially optimal quantity uantity < socially optimal quantity nents a subsidy equal to marginal

Negative Externality: A Tax	Positive Ext

Positive Externality: A Subsidy

change the private costs so

# Asymmetric Info

- When one party to a transaction has relevant info but doesn't share it with the other party
- Effect: markets fail (to produce the quantity where p = MC = minimum ATC)
- Adverse Selection (before transaction)
  - When the selection of goods offered for sale is not a random selection but is instead an "adverse" (unfavorable) selection
- Can be addressed with screening
- Moral Hazard (during contract)
- When one party to a contract changes behavior after the contract is signed, typically due to incentives contained in the contract itself
- Can be addressed with monitoring

#### **Behavioral Concepts**

#### Risk aversion

- People (which includes businesspeople) consider not just the mean of a distribution but also its variance
- Risk averse people dislike wide variance
- Might make "irrational" (not profit maximizing) decisions in order to avoid or reduce risk
- Loss aversion
  - People consider not just the mean of a distribution but also whether its range includes possible losses
  - Loss averse people dislike incurring losses
  - Might make "irrational" (not profit maximizing) decisions in order to avoid incurring a possible loss

# Macroeconomics

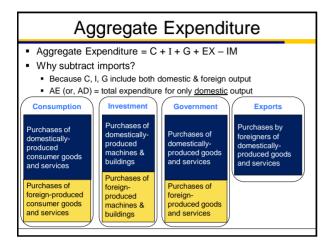

- Three main topics
  - Unemployment
    - Out of work & looking for work; current rate = 3.7 %
  - Inflation
    - Annual rate of increase of CPI; current rate = +2.5 %;
    - Core rate (all items less food & energy) = +2.1%
  - (Long-run) Economic Growth (This was PPF)
    - + Rate of growth of real GDP ; current ~ 3.5 %
- Unemployment is determined by employment which is determined by output produced which is determined by aggregate demand for output

# Gross Domestic Product (GDP)

- GDP
  - Total annual economic output in a nation
  - Omissions from GDP
  - Non-market activities
  - Unreported cash income
  - Illegal activities
- Measurement system: National Income & Product Accounts

#### Expenditure Side of NIPA

- Consumption spending C
  - Investment spending I
  - Government spending G
  - Export spending EX
- Import spending IM
- mpc = how households respond to a <u>change</u> in disposable income
   mpc < 1 usually</li>

Equilibrium	
	Y <sub>E</sub> (equilibrium output) may not equal Y <sub>FE</sub> (full employment output)
	"Unemployment Equilibrium" exists when $Y_E \ll Y_{FE}$
	$Y_{FE}$ - $Y_{E} \equiv$ output gap

# **Consumption Spending**

C depends upon

► YD

▶ wealth

- interest rates (i)
- credit availability

.

loss aversion

- expectations
- mpc = how households respond to a <u>change</u> in disposable income
  - mpc < 1 usually</p>
  - Simplest models assume mpc constant across groups and over time, but is it?
    - Bunker (#17): mpc decreases as household wealth increases
    - · Auerbach & Gorodnichenko (#21): multiplier differs between recession & expansion

#### **Investment Spending** Interest Rates (i) matter Business spending for $\uparrow i \rightarrow \downarrow$ Investment construction $\downarrow$ i $\rightarrow$ $\uparrow$ Investment new equipment Expected rates of return ( rr<sup>e</sup> ) matter Δ value of inventory ↑ rr<sup>e</sup> → ↑ Investment holdings $\downarrow$ rr<sup>e</sup> $\rightarrow$ $\downarrow$ Investment Profit maximizing decision · Compare expected rate of In a credit crisis, credit availability return (exclusive of interest matters rate costs) on investment $\uparrow$ Credit availability $\rightarrow \uparrow$ Investment project (rre) with interest rate $\checkmark$ Credit availability $\rightarrow \checkmark$ Investment on financial assets or loans ( i) Assumes no risk aversion, no

# **Government Spending**

#### Fiscal Policy Tools

- G: Government spending -- direct fiscal policy
- TR: Transfer payments -- indirect fiscal policy
- TA: Taxes
- -- indirect fiscal policy Budget Deficit = (G + TR) – TA; measured annually

#### Expansionary fiscal policy

- Shifts AD up → increase GDP
- ↑G or ↑TR or ↓TA
- Increases deficit

#### Contractionary fiscal policy

- Shifts AD down → decrease GDP
- ↓ G or ↓ TR or ↑ TA
- Decreases deficit

#### How gov't spends money matters!

 $\Delta Y_{\rm F}$  = (spending multiplier) \* (initial  $\Delta$  spending)

Direct Policy Action:  $\Delta G$ So, initial  $\Delta$ spending =  $\Delta$ G and  $\Delta Y_{E} = \Delta G^{*}$  multiplier

Indirect Policy Action: ΔTR or ΔTA So, initial  $\Delta$ spending = mpc \*  $\Delta$ TR (or  $-mpc * \Delta TA$ ) and  $\Delta Y_E = \Delta TR * mpc * multiplier$ 

Government spending has a greater effect on GDP than do changes in taxes or transfer payments (if initial  $\Delta C < \Delta YD$ ) assuming same mpc relevant to  $\Delta Y$  and  $\Delta TR$  or  $\Delta TA$ 

# **Deficits and Debt**

- Government outlays = G + TR
- Government receipts = TA
  - If, in one year, G + TR > TA: budget deficit
  - If, in one year, TA > G + TR: budget surplus
- Structural deficit
- · How big the deficit would be if the economy were at full employment
- Cyclical deficit
- How much larger the deficit is because unemployment is above 5 %

#### Issues related to deficit & debt

- · Decreasing structural deficit is contractionary
- · But concern is sustainability of structural deficit

#### Demand & Supply of Foreign Currency (FX) D<sub>FX</sub> Those with \$ who want FX Depends on U.S. demand for • ... foreign goods & services • ... foreign financial assets S<sub>FX</sub> Those with FX who want \$ Depends on foreign demand for ... U.S. goods & services ... U.S. financial assets

#### Interest rates affect exchange rates

#### If interest rates ↑ in U.S.

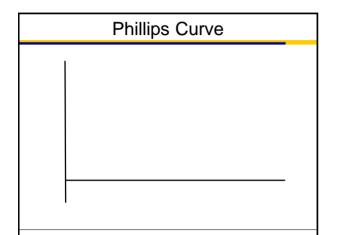

- ↑foreign demand for U.S. financial assets
   Which ↑S<sub>FX</sub> offered in exchange for dollars
- ↓U.S. demand for foreign assets
   Which ↓D<sub>FX</sub> by people & institutions that hold dollars
- ↑ supply & ↓ demand have same price effect:
  - P<sub>FX</sub> ↓ (dollar stronger)
- If interest rates ↓in U.S.
  - $\psi$  foreign demand for U.S. financial assets:  $\psi S_{FX}$
  - ↑U.S. demand for foreign assets: ↑D<sub>FX</sub>
  - ↓S & ↑D have same price effect: P<sub>FX</sub> ↑ (dollar weaker)

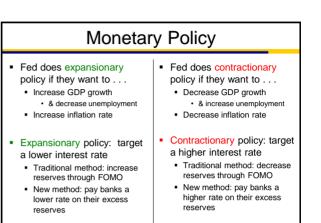

#### From P<sub>FX</sub> to Imports & Exports

- If P<sub>FX</sub> falls (dollar stronger) → fewer \$ per FX
   → imports less expensive, so IM rise and exports more expensive, so EX fall
- If P<sub>FX</sub> rises (dollar weaker) → more \$ per FX → imports more expensive, so IM fall and exports less expensive, so EX rise

Multiplier Process	
Any initial Δ	spending results in a much larger $\Delta Y_E$ because
1)	$\Delta$ spending $\rightarrow \Delta$ output
2)	$\Delta output \rightarrow \Delta Y$
3)	$\Delta Y \rightarrow \Delta Y D \rightarrow \Delta C$
	and $\Delta Y \rightarrow \Delta IM$
Definition	$multiplier = \frac{total \ \Delta Y}{initial \ \Delta planned \ AE}$
& one p	ossible formula:
	1 - [mpc - mpm]

#### Fed has only one tool: interest rates

- If goals are consistent, strategy straightforward
  - Consistent Goal: Increase GDP growth (lower unemployment) and increase inflation rate → target lower interest rate
  - Consistent Goal: Decrease GDP growth (higher unemployment) & decrease inflation rate → target higher interest rate
- · But if goals are inconsistent, choice required
  - Inconsistent Goals: Increase GDP growth (lower unemployment) and decrease inflation rate → can't do both at once
  - Inconsistent Goals : Decrease GDP growth (higher unemployment) and increase inflation rate → can't do both at once
  - Choice depends on how FOMC members rank unemployment vs inflation as problems (doves vs. hawks)

# Inflation Hawks And Doves

- Taylor Rule
  - Fed reacts to inflation <u>and</u> unemployment
  - Target value of interest rate =
    - neutral value of interest rate
    - + A\*(actual goal inflation rate)
    - β\*(actual goal unemployment rate)
- Inflation hawk
  - very focused on inflation. Value of A very large relative to value of  $\boldsymbol{\beta}$
- Inflation dove
  - focused on unemployment as well as inflation. Value of A smaller for doves than for hawks.

# 2008-2015 Issues in Fed Policy

- Fed lowered FFR to essentially 0 in December 2008
   "zero lower bound"
- Yield Curve: LT rates didn't follow ST rates in 2008-9
  - Fed implemented "QE" starting in 2009
  - Bought LT Treasuries & MBS to lower LT rates
- Fed entered "normalization" period Dec 2015, gradually returning FFR target to neutral rate
  - What is value of neutral rate? Perhaps 4% ?? But Powell speech on 11/28 implied could be lower than 4, "just above" 2.25%)

# Challenges today

- Source: Janet Yellen speech, Oct. 2016 https://www.federalreserve.gov/newsevents/speech/yellen20161014a.htm
- 1. Should we disaggregate "C" (or "I")?
- 2. What's role of finance in determining AD?
- 3. What determines inflation?
- 4. How are different economies connected?
