| Controls for personal, household and county characteristics in 1910 | No | Yes | Yes |
| 1910 County fixed effects | No | No | Yes |
| Observations | 2,079 | 2,079 | 2,079 |

Notes: Each coefficient is from a separate regression of log earnings score on migrant status ( $=1$ if interregional migrant). Earnings are assigned according to the industry or occupation held in 1910, as described in the text. The control variables differ across the columns. Standard errors are adjusted for clustering at the household level. Column 1 has no control variables. Column 2 controls for age fixed effects, veteran status, a binary variable for blank veteran status, city status, owner-occupied housing interacted with headship status, state-level log income per capita, black percent of county population, black adult literacy rate in the county, black children's school attendance in the county, and percent of farm acres in cotton. All variables pertain to 1910 status except veteran status. The specification in column 3 includes county fixed effects.
Sources: Linked dataset of census records. See the text and data Appendix for description of industry and occupation-based earnings scores, which draw on Lebergott (1964) and Ruggles et al. (2010).

| 1910 County fixed effects | No | No | Yes | Yes | No | No | No |
| 1910 Household fixed effects | No | No | No | No | Yes | No | No |
| Differenced dependent variable (1930-1910) | No | No | No | No | No | No | Yes |
| Observations | 5,055 | 5,055 | 5,055 | 403 | 403 | 1,935 | 1,935 |

Notes: Each coefficient is from a separate regression of log earnings on migrant status ( $=1$ if interregional migrant). All are statistically significant at the 5 percent level. Control variables and sample sizes vary across columns. Standard errors are adjusted for clustering at the household-of-origin level. Column 1 has no control variables. It is simply the difference between migrants' and nonmigrants' earnings. Column 2 controls for age fixed effects, veteran status, city status, owner-occupied housing interacted with headship status, state-level $\log$ income per capita, black percent of county population, black adult literacy rate in the county, black children's school attendance in the county, and percent of farm acres in cotton. All control variables pertain to 1910 except veteran status. Column 3 adds county fixed effects. Columns 4 a and 4 b are based on a subsample of brothers, and 4 b includes household level fixed effects. Columns 5a and 5b are based on a subsample of men observed in the labor market in both 1910 and 1930, and the dependent variable in 5b is change in log earnings from 1910 to 1930. Cost-of-living adjustments are applied to the "real earnings" rows, based on Stecker (1937) and Koffsky (1949).
Sources: Linked dataset of census records. See the text and data Appendix for description of industry and occupa-tion-based earnings scores and cost-of-living.
