

Employment Adjustment and COVID: Some Thoughts on Theory and Reality

Benjamin Schoefer
UC Berkeley

Thursday 15th October, 2020

CEPR-IZA-OECD Workshop:
Employment Support Strategies during COVID-19

A Separation: Micro

Firm's and worker's present values from the job:

$$V_{\text{now}}^{\text{Firm}} = p_{\text{now}} - w_{\text{now}} + \beta^{\text{Firm}} V_{\text{later}}^{\text{Firm}}$$
$$V_{\text{now}}^{\text{Worker}} = a_{\text{now}} + w_{\text{now}} + \beta V_{\text{later}}^{\text{Worker}}$$

Separate if either value is smaller than respective outside options, $O_{\text{now}}^{\text{Firm}}$, $O_{\text{now}}^{\text{Workers}}$.

Privately inefficient separation: firm & worker could have found a wage w to bribe each other into continuing. Hall Lazear JLE 1984, Jaeger Schoefer Zweimueller WP 2020

Can think of COVID shock as

Static: Marginal revenue product of labor ↓

- Friction: wage rigidity
- Policy remedy: payroll tax cuts; short-term work

Jaeger Schoefer Zweimueller WP 2020

Dynamic: Firm's β ↓

- Friction: financial constraints – “wrong discount factor”
- Policy remedy: liquidity provision (loans, transfers, equity)

e.g., Schoefer WP 2015

A Separation: Micro with Layoff Taxes τ and STW σ

Firm's and worker's present values from the job:

$$V_{\text{now}}^{\text{Firm}} = p_{\text{now}} - (w_{\text{now}} - \sigma) + \beta^{\text{Firm}} V_{\text{later}}^{\text{Firm}}$$
$$V_{\text{now}}^{\text{Worker}} = a_{\text{now}} + w_{\text{now}} + \beta V_{\text{later}}^{\text{Worker}}$$

Separate if either value is smaller than respective outside options, $O_{\text{now}}^{\text{Firm}} - \tau$, $O_{\text{now}}^{\text{Workers}}$.

Privately inefficient separation: firm & worker could have found a wage w to bribe each other into continuing.

Hall Lazear JLE 1984, Jaeger Schoefer Zweimueller WP 2020

Can think of COVID shock as

Static: Marginal revenue product of labor \downarrow

- Friction: wage rigidity
- Policy remedy: payroll tax cuts; short-term work

Jaeger Schoefer Zweimueller WP 2020

Dynamic: Firm's $\beta \downarrow$

- Friction: financial constraints – “wrong discount factor”
- Policy remedy: liquidity provision (loans, transfers, equity)

e.g., Schoefer WP 2015

STW: Challenges & Alternatives

- France Cahuc Kramarz Nevoux WP 2018
- Germany Baleer Gehrke Lechthaler Merkl EER 2016
- Italy Giupponi Landais WP 2020
- Switzerland Kopp Siegenthaler WP 2019
- Austria Jaeger Osterwalder Schoefer Zweimueller \geq 2021

Policy alternatives:

- Wage rigidity: payroll tax cuts for incumbents Birinci Karahan Mercan See WP 2020
- Preserving matches: temp layoffs & recalls Saez Schoefer Seim AER 2019, WP 2020
- Insurance: UI Nekoei Weber WP 2020
- Liquidity provision: loans, transfers Granja Makredis Yannelis Zwick WP 2020

Challenges:

- **Hard** to measure surplus \Rightarrow diagnose ineff sep's Jaeger Schoefer Zweimueller WP 2020
- High replacement rates of STW vs. UI
- How transitory is the COVID shock really?

Separations: Macro Aspects

An EU separation moves one more worker from employment into unemployment...

Externalities:

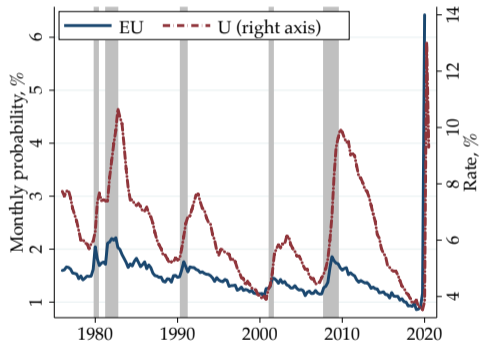

- Search externalities, augmented Hosios conditions,... Lalive Landais Zweimueller AER 2015
- Aggregate consumer demand channel Lorenzoni Guerreri Straub Werning WP 2020

Key Q: effect of EU sep'ns on unemployment (!) Mercan Schoefer Sedlacek WP 2020

- Standard search and matching (DMP) models: **extremely short half life** of sep-induced disturbance to unemployment
- Data: large & persistent effects on unemployment of EU separations
- **Consistent with non-standard "congestion" models** Mercan Schoefer Sedlacek WP 2020

Separations: US Time Series

Mercan Schoefer Sedlacek WP 2020

Separations: US Time Series

Beyond the Labor Market

Perhaps most importantly, displacement, particularly in recessions, is associated with negative effects on

see Davis von Wachter 2011 for lit review

- Well being
- Health & mortality
- Family outcomes

“If not now, when else?”

vs.

“If now yes, should we ever not?”

“We should blanket-subsidize (STW etc.) match preservation in response to COVID, which is perhaps among the largest (transitory?) shocks imaginable.”

⇒ “We should blanket-subsidize (STW etc.) match preservation in response to all transitory shocks.”

Uncomfortable implication (at least in simple models) – perhaps not in the presence of informational frictions etc... I do not see a clear answer.
