Econ 234C – Corporate Finance
Lecture 6:
Internal Investment (IV): Overconfidence
External Investment (I): Stylized Facts

Ulrike Malmendier
UC Berkeley

March 5, 2008
Outline (next two or three lectures)

1. Exams, Homeworks etc.

2. Internal Investment (IV): Managerial Hubris

3. External Investment (I): Stylized Facts

4. External Investment (II): Corporate Control and Voting

5. External Investment (III): Market Inefficiencies

6. External Investment (IV): Managerial Hubris
1 Exams, Homeworks etc.

- Exams (midterm, final)
  - Homeworks give a basic idea, but exams will be closer to research (theory: playing around with a different approach; empirics: evaluate an empirical approach, suggest an empirical approach).
  - It is not necessary that you have done the homeworks.
  - Similar to open questions asked in class, e.g. how an objective function would change if under different incentives; how to measure exogenous shocks to cash flow.
  - Midterm: 3/19
  - Final: 5/21
• Field Exam in CF
  – papers & topics discussed in class
  – NOTE: I keep adjusting the syllabus to reflect what we are covering.
  – Textbook for (part of) the theory: Tirole’s CF book; Hart’s Clarendon Lectures, 2nd part

• Your research
  – 3rd years and higher: please come and see me!
    (Also second-years, of course ...)
  – “Ross Levine research sheet” ready.
“Pseudo-Homework”

Provide a write up of your best research idea, using the Levine research sheet.

“Due” after Spring Break.
Suppose you are interested in the question whether (suboptimal) merger decisions are related to CEO incentives (CEO compensation). You decide to investigate the relationship between (i) firm size and CEO compensation and (ii) merger volume and equity compensation of CEOs using as large as possible a sample that SDC, Compustat and ExecuComp allow you to use.

1. Generate the sample of firms/CEOs for which you have all data necessary to analyze firm size, merger activities AND compensation. Provide detailed summary statistics.
   - Please include a detailed description of each step of the data generating process, especially how exactly you download the data from SDC.
   - Be also detailed about the matching process between the data sets: how do you match? (Which identifier?) At what step do you lose how many observations? (Provide a matrix with the details.)
2. Document the stylized features (summary stats full sample, summary stats over time) of merger activities and CEO compensation for your sample.

3. Relate compensation to size and to mergers.

4. What do you conclude? What are the limits of what you can conclude from that type of exercise (endogeneity, data issues, ..)?

5. Do you have an idea how to overcome these limits?

*Note:* You need to use STATA. Provide a detailed description of your empirical steps and spell out the exact regression specification (regression model, calculation of standard errors). Please include your full do-file. I may ask for your dta-files.

*Due:* next week in class (March 12, 2007)
Remarks

- Definition of variables:
  - previous literature;
  - differences in previous literature;
  - comparability with previous literature (!);
  - your own judgement;
  - Examples: Q

- If no one has ever used “your” preferred definition, think twice. (Data missing? Accounting differences?) But also: think whether there might be a paper, e.g. if a large set of companies is investment-cash flow sensitive according to one measure but not another.

- Most recent definitions in major papers: Use the definitions in my paper “Who makes acquisitions? CEO overconfidence and the Market’s reaction.”
2 Internal Investment: Overconfidence
Why don’t CEOs Invest Optimally?

2 Standard Stories

Asymmetric Information
Myers and Majluf (1984)

Agency Problems
Jensen and Meckling (1976)
  • empire building (Jensen 1986)
  • tunneling (JLLS 2000)
  • quiet life (Bertrand and Mullainathan 1998)

Alternative Story

CEO wants to maximize shareholder value, but gets it wrong

Overconfidence and other personal characteristics
Measure: Investment-Cash Flow Sensitivity

Empirical Finding: Investment increasing in cash flow, after controlling for investment opportunities.

Standard View: Firm Characteristics
Financing constraints (Fazzarai, Hubbard, Petersen 1988, 2000)

Alternative View: Personal Characteristics
1. CEO is overconfident about his investment projects.
2. CEO views external finance as too costly.
**Investment Decision**

CEO acts in interest of current shareholders. *No agency problem.*

- Strongly efficient capital market. *No asymmetric information.*

CEO chooses investment and financing:

1. cash flow,
2. debt,
3. equity.

**Rational CEO**

- Invests efficiently.
- Investment independent of cash flow.

**Overconfident CEO**

- Overestimates returns.
- Perceived under-valuation.
- Investment depends on cash flow.
Model

Assumptions

1. CEO acts in interest of current shareholders.  
   \textit{(No agency problem.)}

2. Efficient capital market.  
   \textit{(No asymmetric information.)}

3. CEO chooses level of investment $I$ and financing out of  
   - cash flow,
   - equity.  
   \textit{(Debt later.)}
Rational CEO

\[
\max_I \ (A + R(I) + (C - I)^+) / (s + s') \\
\text{s.t.} \quad (A + R(I)) \ (s' / s + s') = I - C \quad \text{if } I > C
\]

with \( A \) assets in place \( I \) investment \( R(I) \) returns \( C \) cash flow \( s \) shares outstanding \( s' \) equity issue

- Invests efficiently: \( R'(I) = 1 \)
- Investment independent of cash flow: \( \frac{dI}{dC} = 0 \)

Known by both the CEO and the investors
Overconfident CEO

\[
\max_I \left( (A + R(I)(1+\Delta)) + [C - I]^+ \right) / (s+s')
\]

s.t. \( (A + R(I)) \left( \frac{s'}{s+s'} \right) = I - C \) if \( I > C \)

- Over-estimation of returns
- Perceived under-valuation

- Invest inefficiently:
  \[
  R'(I^*) = \frac{1}{1+\Delta} \quad \text{if} \quad \hat{I} < C \text{ (over investment)}
  \]
  \[
  \frac{1}{1+\Delta} < R'(I^*) \quad \text{if} \quad \hat{I} > C \text{ (less investment)}
  \]

- Investment depends on cash flow: \( \frac{dI}{dC} > 0 \)
Empirical Predictions

1. Effect of overconfidence: investment sensitive to cash flow.

2. Effective of overconfidence strongest in equity-dependent firms: substitute $C$ with $C + D$
Data

Data on private accounts

   Yermack (1995)

**Key:** Panel data on stock and option holdings of CEOs of Forbes 500 companies 1980-1994

2. Personal information about these CEOs from
   • Dun & Bradstreet
   • Who’s who in finance

Data on corporate accounts

CRSP
COMPUSTAT

Information on investment, cash flow, Q …

</tr>
</tbody>
</table>

All variables are defined in the Appendix.
Overconfidence

**On private accounts**
- Hold on to options.
- Buy additional stock.

Idea: Rational CEO who is
  - under diversified
  - risk averse
should
  - exercise options early
  - not buy additional stock.

**On corporate accounts**
- Invest whenever cash flow available (I/CF sensitivity).
- I/CF sensitivity strongest in equity-dependent firms.
Measure 1: “Holder 67”

Option exercise schedule for risk-averse CEOs (following Hall-Murphy 2001):

Exercise if
  – at least 67% (100%) in the money
  – after vesting period in 5th year.

Measure of Overconfidence (dummy variable):

CDO is overconfident if he
  – “habitually” (at least twice)
  – does not exercise a single option
  – at/before benchmark.

CEO is coded as overconfident
  – from first “late exercise on”
  – or throughout tenure
### Table II

Table VII
Time Series of the Fraction of CEOs Holding 67% in the Money

Despite reaching 67% in the money, the fraction of CEOs holding 67% in the money fluctuates over time, as shown in the graph.
Empirical Specification

\[ I_{it} = \beta_1 + \beta_2 C_{it} + \beta_3 Q_{it} + \beta_4 C_{it} + X_{it}'\gamma + \beta_5 Q_{it} C_{it} + \beta_6 O_{it} C_{it} + C_{it} X_{it}'\gamma + \varepsilon_{it} \]

with

- \( i \) company
- \( t \) year
- \( I \) investment
- \( C \) cash flow
- \( Q \) Tobin’s Q (investment opportunities)
- \( I \) overconfidence
- \( X \) other controls

\[ H_0: \beta_6 = 0 \] (overconfidence does not matter)
\[ H_1: \beta_6 > 0 \] (overconfidence does matter)

Adjusted R-squared: 0.14 0.63 0.14 0.55 0.63 0.63 0.63 0.66

Constant included. Absolute value of t statistics in parentheses.
* significant at 10%; ** significant at 5%; *** significant at 1%
Alternative Interpretations

1. Less risk aversion / more wealth / more diversification.
   * Variation in benchmark or no benchmark: Measure 2, Measure 3

   * Persistence
   * Losses
   * Losers vs. Winners

3. Asymmetric Information (II). Signaling.
   * Need “imperfect signaling.”
   * Habitual stock purchases
   * Weak signaling power of option exercise (EDGAR, financial services firms)
   * Measure 3: Stock purchases in a period disjoint from the investment decision.
Measure 2: “Long Holder”
CEO did not exercise option until last year before expiration. CEO displayed this behavior at least once during sample period.

independent of CEO wealth, risk aversion, diversification

Measure 3: “Habitual Buyer”
CEO was a net buyer of stock during first 5 years in sample.

Robustness Checks

1. Alternative thresholds
2. Normalization by beginning of year assets
3. Control of industry effects
   a. 6 groups by 2 digit SIC codes
   b. 48 groups of Fama and French (1997)
4. Control for firm size
5. Control for financing constraints
Figure I
Regression of Investment on Cash Flow and Exercise Behavior

Figure I. Holder for Different % in the Money

- CEOs
- Overconfident CEOs
- Coefficient on Holder "x" interacted with Cash Flow
Economic Significance

1. Regress $I$ on $Q$, $C$: coefficient on $C = 0.2347$
   
   $20\%$ decrease in sensitivity coefficient

   Regress $I$ on $Q$, $C$, $O$, $O^{\ast}$CF: coefficient on $C = 0.1998$

2. Regress $I$ on $Q$, $C$, controls, $Q^{\ast}C$, controls$^{\ast}C$:
   
   $\frac{dI}{dC} = 0.195$ (or: 1 sd more $C \Rightarrow 0.4009$ sd more $I$)
   
   $83\%$ increase in sensitivity

   Regress $I$ on $Q$, $C$, $O$, controls, $Q^{\ast}C$, controls$^{\ast}C$, $O^{\ast}C$:
   
   $\frac{dI}{dC} = 0.357$ (or: 1 sd more $C \Rightarrow 0.7329$ sd more $I$)
Test Prediction 2

1. Divide firms into quintiles by degree of equity dependence (Kaplan Zingales index)
   Lamont, Polk and Saa-Requejo (2001); Baker, Stein and Wurgler (2001)

2. Does overconfidence matter more in highest quintile?
Kaplan-Zingales Index

\[ KZ = -1.00 \cdot \frac{\text{CashFlow}}{\text{Capital}} + 0.28 \cdot Q + 3.14 \cdot \text{Leverage} - 39.37 \cdot \frac{\text{Dividends}}{\text{Capital}} - 1.31 \cdot \frac{\text{Cash}}{\text{Capital}} \]

- Coefficients from logit regression (PR{financially constrained})
- High values \( \rightarrow \) Equity dependence
  - Leverage captures debt capacity
  - Deflated cash flow, cash, dividends capture cash on hand
  - Q captures market value of equity (Exclude?)

Conclusion

• Measurable impact of personal characteristics on corporate investment:
  - CEO Overconfidence ➔ Investment distortions.
  - Other personal characteristics: cohort, background.
  - Distinction between overconfidence and other personal characteristics: Equity dependence

• Implication:

  Existing forms of corporate governance and incentives insufficient to induce shareholder-value maximization.
3  Mergers and Acquisitions: Introduction

**Why do CEOs make acquisitions?**

1. Synergies (e.g. economies of scale).
2. Attempt to create market power (e.g. forming monopolies)
3. Incompetent target management $\rightarrow$ market discipline
4. Self-serving attempts to overexpand (empire-building, hubris).
5. Advantages of diversification (e.g. internal capital market; diversification for undiversified managers)
6. Mergers = reaction to unexpected shocks to industry structure (Explanation for wave/cluster structure in Mitchel and Nulherin, *JFE* 1996, and Andrade, Mitchell, Stafford, *JEP* 2001; could also be the “trigger” in the informational cascades literature.)

- E.g. technological innovation (creates excess capacity, need for consolidation).
- E.g. financial innovation.
- E.g. supply shock (oil prices; foreign competition).
- E.g. deregulation.
  - 1984: entertainment.
  - 1978: natural gas.
  - 1996: telecommunications.
Importance / Significance of mergers

- Reallocation of resources within and across industries

- 1995: Value of M&A’s = 5% GDP and = 48% nonresidential gross investment

- For a firm an “extraordinary event” often doubling its size within months; large organizational uncertainty; movement of human capital

$\Rightarrow$ Extremely large literature

$\Rightarrow$ In finance, IO, macro; also relevant for labor, public.
Stylized facts

1. Mergers occur in waves.
   - 1920s/1930s: Mergers for market power.
   - 1960s: Mergers for diversification (def.: 2-digit SIC).
     - Decreasing since 1960s.
       - (1970s: 70%, 1980s: 60%, 1990s: 52%)
       - Ultimately failures.
   - 1980s: Mergers for market discipline.
     - 1980s: Half of all major US corporations received a takeover offer.
     - 14% hostile (only?); 4% in 1990s. (*hostile* = target publicly rejects or acquirer describes it as unsolicited and unfriendly)
   - late 1980s and 1990s: Mergers of deregulation.
     - three major waves
     - large multi-billion dollar deals
Figure 1
Aggregate Merger Activity

Fraction of CRSP Firms Acquired

% of Firms
% of Market Cap

Fraction of CRSP Market Capitalization Acquired
2. Within a wave, mergers occur in industry clusters.

- 1970s: Metal Mining, Real Estate, Oil & Gas, Apparel, Machinery
- 1980s: Oil & Gas, Textile, Misc. Manufacturing, Non-Depository Credit, Food
- 1990s: Metal Mining, Media & Telecommunication, Banking, Real Estate, Hotels
3. Merger financing

- 1970s, 1980s: less stock financing
  - 45% any stock
  - 37% or 32% all stock

- 1990s: stock-financing
  - 70% any stock
  - 58% all stock
Why?

... under/overvaluation?

... overconfidence?

... investment bankers?
4. Announcement Effects

- Methodology: Event Study
  
  - Average abnormal stock market reaction at announcement as measure of value creation / destruction.
  
  - Hypothesis: efficient capital market (immediate incorporation of expected value change into stock price).
  
  - Event windows: (a) short: 3 days (-1 to +1) and (b) long: several days prior to announcement to close of merger. [Problem with (b)?]
  
  - Software: Eventus (WRDS)
• AR 1973-1998
  [both acquirer and target publicly traded!]
  [mixing NYSE, NASDAQ, AMEX]:
  value creation (?),
  entirely accruing to target shareholders (!!)
  - Target:
    positive, **significant** (16%) for -/+1
    positive, **significant** (24%) for -20/close
  - Acquirer:
    negative, **insignificant** (-0.7%) for -/+1
    negative, **insignificant** (-3.8%) for -20/close
  - Combined:
    positive, **significant** (1.8%) for -/+1
    positive, **insignificant** (1.9%) for -20/close
• Magnitude
  – Median target value $230m \implies 16\% = $37m
  – Average annual return publicly traded companies = 12\% \implies 16\% normally over 16 months

• Effect much more striking in $$ than in % \implies Moeller et al.
Figure 1. Yearly aggregate dollar return of acquiring-firm shareholders (1980 to 2001). Data are from the SDC Mergers and Acquisitions Database. The graph shows the aggregate dollar return associated with acquisition announcements for each sample year. The aggregate dollar return is defined as the sum of the product of the abnormal return of each announcement multiplied by the equity capitalization of the acquirer.
• Dollar loss of acquiring-firm shareholders = change in the acquiring firm’s capitalization over the three days surrounding acquisition announcements (for transactions exceeding 1% of the market value of the assets of the acquirer)

• Sample: yearly aggregate losses to acquiring-firm shareholders for our sample of acquisitions of public firms, private firms, and subsidiaries from 1980 through 2001.

• From 1991 to 2001: acquiring firms’ shareholders lost an aggregate $216 billion (more than 50 times the $4 billion lost 1980-1990)
• Most of the acquiring-firm shareholder losses took place from 1998 through 2001
  
  – -$4 billion in the 1980s,
  
  

• NOTE: even the aggregate combined value of acquiring and acquired firms falls by a total of $134 billion (public firm acquisition announcements 1998-2001).
5. Announcement Effects and Financing

- **Equity-financed mergers**
  - Acquirer: -1.5%, significant (but insignificant over “-20/close”)
  - Target: 13%, significant
  - Combined: 0.6%, insignificant

- **No-equity**
  - Acquirer: 0.4%, insignificant
  - Target: 20%, significant
  - Combined: 3.6% significant (but insignificant over “-20/close”)

Link to asymmetric information (Myers-Majluf 1984)?
But: “double-signalling” (value of firm, value of merger)
But: variation over time?
But: combination stock/equity?
6. Long-Term Abnormal Returns

• If markets are not fully efficient ...

• On average: negative long-term AR acquirer; overwhelms positive combined stock-price reaction at announcements

• Financing: [Loughran and Vijh (1997)] five-year long-term AR 1970-89
  – Stock-Financed: -24.2%
  – Cash-Financed: +18.5%

• Book-to-Market: [Rau and Vermaelen (1998)] three-year long-term AR 1980-91
  – Value firms: + 7.6%
  – Growth/Glamour firms: -17.3%
  – Why?
* Fama and French (1992, 1993): increased risk of value firms

- But: methodological problems
  - Tests of long-term abnormal performance are joint tests of stock market efficiency and a model of market equilibrium (Fama 1970).
  - Abnormal returns are not independent across firms. (Clustering by industries.)
Next Question: Why and How?

We will think of M&A as “another type of investment” and go over the motivations (models) considered for internal investment.

\[ V(c) = V_A + V_T + e - c \]

and

\[ V^{old}(c) = \frac{s}{s + s'}[V_A + V_T + e - c]. \]
4 Wrap-Up of Stylized Facts and Link to Theory

Empirical findings:

- Huge economic significance (whether measured in dollar value of deals, dollar value of firms involved, shareholder value destroyed at announcement, job lost/created/changed, ..)

- Merger waves

- Merger waves at different times in different industries

- Negative effect on value for shareholders of acquiring company at announcement

- Large amount of stock financing in the 1990s (70% any stock; 58% all stock) compared to 1970s/1980s (45% any stock; 37% / 32% all stock)
**Neoclassical Theory**: “mergers are market instruments to prevent inefficient firm management.” E.g.: efficiency-improving response to industry shocks (e.g. deregulation).

We will review 3 theoretical / empirical approaches to explain the above facts. All are in (partial) contradiction to the neoclassical view:

1. **Free-riding** (Grossman and Hart, 1980)
   - *Deviation from neoclassics*: Free-riding prevents efficient raiding decisions

2. **Misvaluation** theories (Shleifer and Vishny, 2003)
   - *Deviation from neoclassics*: inefficient markets (investor sentiment / investor biases)

3. **Overconfidence / Hubris** theories (Roll, 1986; Malmendier and Tate, 2007)
   - *Deviation from neoclassics*: managerial biases (at least MT does not need much inefficiency)
Readings for next week or week after:

- Shleifer and Vishny (2003), “Stock-market driven acquisitions”

- Malmendier and Tate (forthcoming), “Who makes acquisitions ...” together with Roll (1986) and Heaton (2002) if you have not done so yet.
